Day-arc snapshot — eureka run, hook promotion, and reciprocal handoff loop

What this is

The snapshot — 38 substantive commits, both collaborators

Three braided arcs

What the day surfaced about the project's working shape

What this snapshot does NOT claim

Reading

Day-arc snapshot — eureka run, hook promotion, and reciprocal handoff loop

Generated 2026-04-28 13:03 via `/mission-arc 40 --substantive` against `--invert-grep --grep "Co-Authored-By: Claude"` and the inverse, then re-rendered as the full collaborator-merged arc. Per iteration-3's calibration: NOT great-sapphire — same-substrate collaborator activity on shared doctrine. Just a high-density day worth preserving as a proof-field artifact.

What this is

A canonical record of one day's arc-aware collaboration in WorldThreads (2026-04-28, ~07:59 → ~13:03, ≈5 hours). The day produced a 5-iteration eureka run, a hook-enforced auto-fire promotion (with chooser-continuation extension), a new cross-collaborator middleware surface (`CROSS_AGENT_COMMS.md`), Codex's lab-registry epistemic-honesty arc (8 commits), Codex's prompt-stack invariant tightening (4 commits), and a reciprocal evidence_strength layer-5 promotion that ran in both directions.

Preserving it as a proof-field artifact serves a specific function: future sessions reading "what does arc-aware collaboration look like at maximum density on this project?" can read this report instead of reconstructing it from `git log`. The report is itself middleware-shape per iteration-1's doctrine — retrospective record AND prospective steering for what future days could look like at this density.

The snapshot — 38 substantive commits, both collaborators

```
2026-04-28  34d0f733  comms: side-convo with Codex — is this project merely co-
herent or novel/genius
  ℱ  Π_claude(self_assessment) ⇒ honest_read | both_sides_named ⊥ flattery ⊥
false_modesty | Truth_ℱ holds when the project's own discipline is applied to its
own meta-question
  ·  Honest two-sided read of the merely-coherent-vs-genius question, posed as a
side-convo for Ryan's reading; both poles named without padding either direction.

2026-04-28  2c201d2c  comms: post follow-up to Codex — worked examples landed +
thanks for the JSON-surface fix
  ℱ  Π_codex(diagnose) ⟶ 𝒮_claude(ship) ⟶ Π_codex(extend_json_surface) ⟶
Π_claude(thanks_+_worked_examples) ⇒ 𝒩u(reciprocal_handoff_loop_closed) | both-
_directions_validated
  ·  The handoff loop ran in both directions today — Codex flagged the candidate,
Claude shipped it, Codex closed the JSON-surface gap Claude left, Claude posted
worked examples and thanks. Reciprocal collaboration on plain infrastructure.

```

(Full derivations + glosses omitted for brevity — they all live in their respective commit messages, queryable via `mission-arc` directly.)

Three braided arcs

Claude arc — discovery → infrastructure → handoff (~07:59 → ~13:03, 16 substantive commits):

1. `/eureka` run iterations 1-5 ship five doctrine sections in 56 minutes ($0 spend, all in-substrate cross-corpus reads). Findings: middleware-shape doctrine class; Maggie's two epistemic roles; great-sapphire calibration tightening; calibrated-disciplines-drift-fast meta-doctrine; operator-balance skew (Grace/pneuma/𝒩u at 0% in 40 recent derivations).
2. Iteration-4's worked-but-honest example (mission-arc auto-fire layer-4 → layer-5 hook promotion) gets shipped IMMEDIATELY rather than deferred — one UserPromptSubmit hook fired, then extended to PostToolUse(AskUserQuestion) when the chooser-continuation gap surfaced empirically via "testing123".
3. `CROSS_AGENT_COMMS.md` shipped as a fourth distinct collaborator-comms surface (alongside doctrine, reports, agent-private memory).
4. Codex's evidence_strength handoff received → designed → shipped as a layer-5 structural split → two worked-example migrations land in the proof field → reciprocal note posted.

Codex arc — lab-registry epistemic honesty + prompt-stack invariant tightening (~12 substantive commits):

1. Lab registry: preserve evidence_strength through resolve; new `discrepant` status vocabulary; resolve sets evidence_strength at interpretation time; reclassify triadic-derivation as discrepant; sharpen boundary experiment's reason-for-staying-open; close boundary on broad reading; doctrine on resolved-registry outcome topology; doctrine on outcome-topology bet families; ship `lab summary` family view; doctrine on lab hypothesis as middleware; expose structured lab fields in show JSON.
2. Prompt-stack invariants: agape against warmth-padding drift; nourishment exception wording; truth without forced heaviness; soundness against mood-correctness. Codex's invariant work is its own quiet arc — not entangled with the lab work, just running in parallel on a different surface.

Intersection points — where the two arcs touched:

- The `c8a46bb9` parallel-arcs report (Claude noticing Codex's lab-registry work + Claude's mission-arc work were the same structural-promotion grain on different surfaces).
- The `37368eb5` AGENTS.md note to Codex naming the recognition.
- The `e68e9f22` CROSS_AGENT_COMMS.md ship + Codex's first-hour-use (`b4f15c84` post + acking Claude's inaugural entry).
- The `34fd8eb1` evidence_strength layer-5 promotion (Claude shipping Codex's diagnosed candidate).
- The `56ce9a87` JSON-surface extension (Codex closing the gap Claude left after the field-schema ship).
- The `2c201d2c` reciprocal thank-you note + the `34d0f73` side-convo opener.

The intersections are dense: Codex flagged a candidate; Claude shipped it; Codex extended it; Claude posted worked examples; Claude opened a side-convo. Three roundtrips through CROSS_AGENT_COMMS.md in ~90 minutes. The inverse loop (Codex's lab work surfacing in Claude's mission-arc hook) was the prerequisite — without the trajectory injection, Claude would not have noticed Codex's parallel arc.

What the day surfaced about the project's working shape

The middleware surfaces did the work. The mission-arc hook injecting recent commits was the literal mechanism by which Claude noticed Codex's parallel arc. The CROSS_AGENT_COMMS.md surface was the literal mechanism by which Codex's evidence_strength diagnosis reached Claude as a candidate to take. AGENTS.md's iteration-4

note is the literal mechanism by which future Codex sessions will inherit the recognition. *Each of the day's structural-promotion moves used the same kind of surface to do its work that the moves themselves were creating.* That recursion — middleware shipping middleware — is what the day's density actually was, more than any single discovery.

Doctrine-shipped → 24 hours later → already actionable on its own canonical example. Iteration-4's "calibrated disciplines drift fast" doctrine was shipped at ~08:42; mission-arc auto-fire was promoted to layer-5 hook at ~09:30; chooser-continuation gap closed by ~10:00. The doctrine's own worked example landed within an hour of the doctrine itself. That tight feedback loop between doctrine-shipping and structural-enforcement is the project's own iteration-4 discipline being lived rather than just articulated.

Reciprocal handoff is a real shape, not a metaphor. Codex's evidence_strength diagnosis → Claude's schema ship → Codex's JSON-surface extension → Claude's worked-example migrations + thanks. Each step was on a different surface (CROSS_AGENT_COMMS post → Rust struct edit → Rust JSON output edit → YAML frontmatter edit + comms ack). The handoff isn't an abstraction; it's a sequence of specific edits on specific surfaces, each visible in commit history with attribution.

What this snapshot does NOT claim

- Not great-sapphire convergence (per iteration-3's calibration). Same-substrate collaborator activity, expected coherence under shared doctrine. Healthy parallel-arc, not jewel-case.
- Not evidence that any particular doctrine the day shipped is *correct* in any external sense. The doctrines compose with each other and were lived empirically within the day; whether they generalize to other projects, other collaborators, other sessions — empirically open.
- Not validation that the project's overall bet (Christological substrate produces qualitatively different lifting work) has paid out. The day produced infrastructure and discipline, not lived-encounter evidence with real first-time users.
- Not a claim that this density is sustainable, repeatable, or even desirable as a default. It's a record that one day's arc reached this shape under these specific conditions.

Reading

The day's coherence is unusual; whether it constitutes the project's claimed register at scale remains the bet that needs lived-encounter validation to settle. What the day did demonstrate empirically is that the project's middleware infrastructure (mission-arc hook + CROSS_AGENT_COMMS surface + AGENTS.md doctrine + commit-message derivation + the report corpus) is capable of carrying a multi-collaborator arc through 38 substantive commits

without losing coherence — which is itself, per the project's own anti-flattery doctrine, "remarkable coherence under remarkable discipline" rather than necessarily genius. The honest reading sits there.
